SUMMARY

DevOps-focused IT professional with 1 year of experience managing production Windows and Linux environments, automating operational tasks, and troubleshooting enterprise applications. Hands-on experience building cloud-native DevOps solutions using AWS, Docker, Kubernetes, Terraform, Jenkins, Argo CD, and Ansible, with a strong focus on CI/CD, Infrastructure as Code, and cloud automation.

EDUCATION

Bachelor of Engineering in Information Technology
CGPA: 8.3/10

May 2025
Mumbai University

SKILLS

Cloud & DevOps: AWS, Kubernetes, Docker, Terraform, Ansible, Argo CD, Jenkins, GitHub Actions

Infrastructure & Operations: Linux, Windows Server, Networking, SSL/TLS, SMTP, CI/CD, Production Support

Monitoring & Automation: Prometheus, Grafana, Power BI, Bash, PowerShell, Python

Databases & Tools: Microsoft SQL Server, PostgreSQL, MySQL, MongoDB, Git, GitHub, Flask

EXPERIENCE

Support Analyst — Vector Consulting Group

June 2025 – Present

- Managed production Windows and Linux servers, troubleshooting application, infrastructure, and deployment issues to maintain service availability and minimize downtime.
- Performed SSL certificate renewals and binding updates for multiple client environments, ensuring secure communication and uninterrupted service.
- Automated routine operational tasks using PowerShell and Bash scripts, including server health checks, log monitoring, and daily maintenance activities, reducing manual effort and improving operational efficiency.
- Investigated application issues by analyzing logs, verifying Windows services and Linux processes, checking port availability with Netstat, validating API connectivity, and resolving frontend/backend service failures.
- Configured and troubleshoot SMTP services for automated client email notifications and alerts, ensuring reliable email delivery across production environments.
- Used Microsoft SQL Server (SSMS) and PostgreSQL (pgAdmin) to execute SQL queries for data validation, incident investigation, and application troubleshooting.
- Developed Power BI dashboards to monitor and manage client configurations, operational metrics, and environment health, improving visibility for support and operations teams.
- Collaborated directly with clients to resolve complex technical issues, explain root causes, and provide production support while coordinating with development and infrastructure teams.
- Monitored production server health, application services, and scheduled jobs, proactively identifying issues to maintain system availability and performance.
- Applied DevOps practices through self-driven projects using Docker, Kubernetes, Jenkins, Argo CD, Terraform, Ansible, and AWS to build CI/CD pipelines, automate infrastructure provisioning, and deploy containerized applications.

PROJECTS

Full-Stack DevOps Project — Task Manager Application

- Built and deployed a 3-tier Task Management Application (React, Flask, PostgreSQL) using Docker and Kubernetes with Nginx Ingress, ConfigMaps, Secrets, Persistent Volumes, and Horizontal Pod Autoscaler.
- Designed and implemented a GitOps-based CI/CD pipeline using Jenkins and Argo CD to automate Docker image builds and Kubernetes deployments from GitHub.
- Integrated Prometheus and Grafana to monitor application health, container metrics, and Kubernetes cluster performance through real-time dashboards.
- Optimized Docker images using multi-stage builds and distroless images, improving deployment efficiency and reducing container image size.
- Troubleshoot production-like issues including CORS errors, Ingress routing, Kubernetes networking, image pull failures, and autoscaling conflicts while validating rolling updates.

Secure Multi-AZ AWS VPC Architecture

- Designed and implemented a highly available multi-AZ VPC with public and private subnets, Internet Gateway, NAT Gateway, and custom route tables.
- Configured Security Groups and Network ACLs following least-privilege principles to secure communication between application tiers.
- Deployed EC2 instances across public and private subnets and validated secure connectivity using Bastion Host, NAT Gateway, and SSH access controls.
- Provisioned networking resources using Terraform modules, enabling repeatable Infrastructure-as-Code deployments.
- Performed end-to-end network validation by troubleshooting routing, subnet associations, security group rules, and internet connectivity.

Placement Connect

- Developed a full-stack placement management platform using Flask and MongoDB with ML-based resume analysis and Power BI dashboards.
- Designed RESTful APIs for student, recruiter, and administrator workflows with secure database integration.
- Containerized the application using Docker, enabling consistent deployments and reproducible development environments.
- Implemented role-based authentication and database-driven workflows to manage student registrations, job postings, and placement activities.
- Published the project in Springer LNEE (PEIS Conference, SCRS 2025) and secured software copyright registration.

AWS Infrastructure Automation with Terraform and Ansible

- Provisioned AWS infrastructure including EC2 instances, Security Groups, networking resources, and key pairs using Terraform following Infrastructure-as-Code best practices.
- Developed reusable Terraform modules to standardize infrastructure provisioning and simplify resource management.
- Automated Linux server provisioning using Ansible playbooks to install, configure, and manage Nginx across multiple environments.
- Integrated Terraform provisioning with Ansible configuration management to establish an automated infrastructure deployment workflow.
- Troubleshoot networking, SSH connectivity, IAM permissions, and infrastructure deployment issues to ensure reliable cloud provisioning.
